Monthly Factsheet - 29/08/2025

INVESTMENT OBJECTIVE

International fixed income fund that implements interest rate, credit and currency strategies across the globe. Its flexible and opportunistic style enables the Fund to implement a largely unconstrained, conviction-driven allocation and swiftly adapt, when necessary, to fully exploit opportunities in all market conditions. In addition, the Fund seeks to invest sustainably for long-term growth and implements a socially responsible investment approach. The Fund aims to outperform its reference indicator over 3 years.

Fund management analysis can be found on P.3

FUND MANAGEMENT ANALYSIS

MARKET ENVIRONMENT

- US data sent mixed signals with July nonfarm payrolls disappointed with just +73k jobs, alongside downward revisions of -258k for May and June. Meanwhile, inflation data surprised on the upside, with core CPI rising to +3.1% YoY and PPI accelerating to +0.9% in July. Nevertheless, Q2 GDP was revised higher to +3.3%, supported by stronger personal consumption.
- Despite sticky inflation, Powell's dovish tone at Jackson Hole emphasized rising labor market risks and reinforced expectations of a September rate cut. However, President Trump's attempt to remove Governor Lisa Cook, raised concerns about Fed independence and contributed to steeper yield curves.
- In Europe, signs of stabilization appeared as August flash PMIs showed modest growth. Germany's manufacturing rebound led the way and eurozone data confirmed expansion and inflation held near 2%.
- In France, the announcement of a confidence vote and the risk of a government collapse if no agreement is reached on the austerity plan proposed for the 2026 fiscal year, weighed on markets and pushing the OAT/Bund spread to 79 bps, its highest since 2024.
- In August, yield curves steepened on both sides of the Atlantic. In the US, the move was pronounced, with the 2Y falling by -34 bps versus -14 bps for the 10Y, as markets priced in rate cuts. In Germany, the shift was modest, with the 2Y down -2 bps and the 10Y up +3 bps.
- On the currency front, the US dollar resumed its decline amid expectations of accelerated rate cuts and concerns about the Fed's independence. As a result, the US dollar weakened against all other G10 currencies in August, and the dollar index fell 2.2% over the month.

PERFORMANCE COMMENTARY

- During the month, the fund posted a positive performance, outperforming its reference indicator.
- Against a backdrop of falling interest rates focused on short end of the curve, the fund benefited from our long positions in US rates, as well as our short positions in 10-year French bonds. However, pressure on rates across the Channel penalised our long position in UK debt. Finally, our selection of local emerging market debt in Brazil and Eastern Europe continued to perform well.
- In terms of credit, our selection of bonds in the energy sector, as well as our selection of emerging market debt denominated in hard currencies, made a positive contribution.
- Finally, in terms of currencies, although the portfolio maintained limited exposure to the US dollar, it was penalised by its general decline during the month.

OUTLOOK AND INVESTMENT STRATEGY

- Against a backdrop of uncertainty linked to the impact of tariffs, geopolitical tensions and the risk of fiscal slippage in certain countries, we anticipate that the major central banks in developed and emerging countries will maintain an accommodative stance. In this context, we are therefore maintaining a relatively high level of modified duration, around 5.
- Regarding interest rates, we have a slightly bearish position on the short end of the US curve, with the market optimistically pricing in five rate cuts, but also on the long end, where the risk of budget slippage and concerns about the Fed's independence are pushing rates higher. In Europe, we are long on core countries, with the market no longer anticipating further rate cuts, and short on France due to political and fiscal risks. We are also positioned for lower UK and Canadian rates, given the deterioration in economic data and short Japanese rates, where the inflation outlook has been revised upwards. Finally, we remain selective on emerging market local rates, which are benefiting from high real rates, as in Brazil, but also in some Eastern European countries.
- On credit, we are maintaining significant exposure, benefiting from an attractive carry. However, given the relatively tight valuations, we remain cautious and are maintaining a high level of hedging on the iTraxx Xover to protect the portfolio from the risk of widening spreads
- Finally, in terms of currencies, we are maintaining limited exposure and continuing to limit our exposure to the US dollar. Our currency selection includes Latin American currencies (the Brazilian real and Chilean peso) and commodity-linked currencies (the Australian dollar, Canadian dollar and Norwegian krone). Finally, we are maintaining a long position on the Japanese yen, as the Bank of Japan is likely to be the only central bank to raise rates this year.

GLOSSARY

Alpha: Alpha measures the performance of a portfolio compared to its reference indicator. Negative alpha means the fund performed less well than its reference indicator (e.g. if the indicator increased by 10% in one year and the fund increased by only 6%, its alpha is -4). Positive alpha means the fund performed better than its reference indicator (e.g. if the indicator increased by 6% in one year and the fund increased by 10%, its alpha is 4).

Beta: Beta measures the relationship between the fluctuations of the net asset values of the fund and the fluctuations of the levels of its reference indicator. Beta of less than 1 indicates that the fund “cushions” the fluctuations of its index (beta = 0.6 means that the fund increases by 6% if the index increases by 10% and decreases by 6% if the index falls by 10%). Beta higher than 1 indicates that the fund “magnifies” the fluctuations of its reference indicator (beta = 1.4 means that the fund increases by 14% when the index increases by 10% but also decreases by 14% when the index decreases by 10%). Beta of less than 0 indicates that the fund reacts inversely to the fluctuations of its reference indicator (beta = -0.6 means that the fund falls by 6% when the index increases by 10% and vice versa).

Capitalisation: A company's stock market value at any given moment. It is obtained by multiplying the number of shares of a company by its stock exchange price.

Duration: A bond's duration is the period beyond which interest rate variations will no longer affect its return. The duration is like a discounted average lifetime of all flows (interest and capital).

High yield: A loan or bond rated below investment grade because of its higher default risk. The return on these securities is generally higher.

Investment grade: A loan or bond that rating agencies have rated AAA to BBB-, generally indicating relatively low default risk.

Investment/net exposure rate: The investment rate constitutes the volume of assets invested expressed as a percentage of the portfolio. Adding the impact of the derivatives to this investment rate results in the net exposure rate, which corresponds to the real percentage of asset exposure to a certain risk. Derivatives can be used to increase the underlying asset's exposure (stimulation) or reduce it (hedging).

Modified duration: A bond's modified duration measures the risk attached to a given change in the interest rate. Modified duration of +2 means that for an instantaneous 1% rate increase, the portfolio's value would drop by 2%.

Net asset value: Price of all units (in an FCP) or shares (in a SICAV).

Rating: The rating measures the creditworthiness of a borrower (bond issuer).

Sharpe ratio: The Sharpe ratio measures the excess return over the risk-free rate divided by the standard deviation of this return. It thus shows the marginal return per unit of risk. When it is positive, the higher the Sharpe ratio, the more risk-taking is rewarded. A negative Sharpe ratio does not necessarily mean that the portfolio posted a negative performance, but rather that it performed worse than a risk-free investment.

SICAV: Société d'Investissement à Capital Variable (Open-ended investment company with variable capital)

VaR: Value at Risk (VaR) represents an investor's maximum potential loss on the value of a financial asset portfolio, based on a holding period (20 days) and confidence interval (99%). This potential loss is expressed as a percentage of the portfolio's total assets. It is calculated on the basis of a sample of historical data (over a two-year period).

Volatility: Range of price variation of a security, fund, market or index, which enables the measurement of risk over a given period. It is determined using the standard deviation obtained by calculating the square root of the variance. The variance is obtained by calculating the average deviation from the mean, which is then squared. The greater the volatility, the greater the risk.

Yield to Maturity: Yield to Maturity (YTM) is the estimated annual rate of return expected on a bond if held until maturity and assuming all payments made as scheduled and reinvested at this rate. For perpetual bonds, the next call date is used for computation. Note that the yield shown does not take into account the FX carry and fees and expenses of the portfolio. The portfolio's YTM is the weighted average individual bonds holdings' YTM within the portfolio.

ESG DEFINITIONS & METHODOLOGY

ESG: E for Environment, S for Social, G for Governance

ESG score Calculation: Only the Equity and Corporate Bond holdings of the fund considered. Overall Fund Rating calculated using MSCI Fund ESG Quality Score methodology: excluding cash and non ESG-rated holdings, performing a weighted average of the normalized weights of the holdings and the Industry-Adjusted Score of the holdings, multiplied by (1+Adjustment%) which consists of the weight of positively trending ESG ratings minus the weight of ESG Laggards minus the weight of negatively trending ESG ratings. For a detailed explanation see “MSCI ESG Fund Ratings Methodology”, Section 2.3. Updated June 2023. <https://www.msci.com/documents/1296102/34424357/MSCI+ESG+Fund+Ratings+Methodology.pdf>

Principal Adverse Impacts (PAI): Negative, material, or potentially material effects on sustainability factors that result from, worsen, or are directly related to investment choices or advice performed by a legal entity. Examples include GHG emissions and carbon footprint.

SFDR Fund Classification: Sustainable Finance Disclosure Regulation (SFDR) 2019/2088. EU Act that requires asset managers to classify funds into categories, “Article 8” funds promote environmental and social characteristics, “Article 9” funds have sustainable investments as a measurable objective. In addition to not promoting environmental or social characteristics, “Article 6” funds have no sustainable objectives. For more information, please refer to <https://eur-lex.europa.eu/eli/reg/2019/2088/oj>

Sustainable Investments: The SFDR defines sustainable investment as an investment in an economic activity that contributes to an environmental or social objective, provided that the investment does not significantly harm any environmental or social objective and that the investee companies follow good governance practices.

Taxonomy Alignment: In the context of an individual company, taxonomy alignment is defined as the proportion of a company's revenue that comes from activities that meet certain environmental criteria. In the context of an individual fund or portfolio, alignment is defined as the portfolio-weight weighted average taxonomy alignment of included companies. For more information, please follow this link: https://ec.europa.eu/info/sites/default/files/business_economy_euro/banking_and_finance/documents/sustainable-finance-taxonomy-faq_en.pdf
