Monthly Factsheet - 31/07/2026

INVESTMENT OBJECTIVE

Carmignac Portfolio Patrimoine is a global, multi-asset UCITS fund offering diversified exposure to international equities (up to 50%), fixed income and currencies. Its dynamic and flexible approach is designed to optimise asset allocation across varying market environments, seeking to capture attractive investment opportunities while maintaining resilience during periods of market stress. The Fund aims to outperform its reference indicator over a three-year recommended investment horizon. The Fund promotes environmental and social characteristics, notably in investing at least 10% of its net assets in sustainable investments based on the framework of the United Nations Sustainable Development Goals (SDGs).

Fund management analysis can be found on P.3

PERFORMANCE

Past performance is not necessarily indicative of future performance. Performances are net of fees (excluding possible entrance fees charged by the distributor). The Fund presents a risk of loss of capital.

FUND MANAGEMENT ANALYSIS

MARKET ENVIRONMENT

- July was dominated by two themes: renewed inflation concerns and growing scrutiny of the AI investment cycle.
- Rising energy prices and resilient macroeconomic data pushed developed market government bond yields higher. Although major central banks kept policy rates unchanged, their hawkish tone reinforced the higher-for-longer narrative. Sovereign yield curves bear steepened on both side of the Atlantic, driven by a stronger rise in long-end yields.
- Macroeconomic data remained resilient on both sides of the Atlantic. US growth moderated while inflation surprised to the downside, whereas euro area growth exceeded expectations but inflation accelerated.
- Early in the month, escalating US-Iran tensions briefly lifted Brent crude above USD 100/bbl, fuelling inflation concerns. As geopolitical risks eased, markets refocused on the Q2 earnings season.
- Q2 earnings shifted investors' focus from AI enthusiasm to AI monetization, leading to greater differentiation across the sector.
- Hyperscalers remained relatively resilient, while semiconductor stocks and other AI beneficiaries came under pressure from stretched valuations, export control concerns and China's technological progress.
- Hedge fund deleveraging accelerated the sell-off in AI-related names, with the SOX falling more than 20% over the month.
- Emerging markets underperformed due to their exposure to semiconductors, while value and quality stocks outperformed in developed markets. Credit markets also weakened, with the iTraxx Xover widening by 16bps.

PERFORMANCE COMMENTARY

- In July, the Fund outperformed its reference indicator, which ended the month in negative territory, while the Fund delivered a return of around +2%.
- The market environment was supportive of our key convictions across all asset classes. As a result, every asset class posted a positive contribution and outperformed the reference indicator.
- On equities, our more cautious positioning proved rewarding during the month. Ahead of the correction, we had reduced our exposure to high-beta technology stocks while increasing our allocation to high-quality companies, particularly in healthcare and financials.
- As a result, the Fund was well positioned to navigate the sharp sell-off in technology stocks. Despite the SOX Index declining by around 20%, our limited exposure to the sector helped protect performance, while our high-quality holdings, including McKesson, ICE, Cencora and Mastercard, rebounded strongly and ranked among the Fund's top contributors during the month.
- On rates, the rise in government bond yields played in our favour. In particular, our negative duration exposure in the US was a key contributor, while our inflation positioning and yield curve steepener strategies also generated positive returns.
- In credit, our hedging strategies helped offset the widening in credit spreads, limiting the impact on portfolio performance.
- Finally, in FX, our underweight exposure to the US dollar, combined with our positions in Asian currencies, particularly the Korean won and the Japanese yen, also made a positive contribution to performance.

OUTLOOK AND INVESTMENT STRATEGY

- Our macro view remains broadly constructive. Global growth continues to prove resilient, supported by strong corporate earnings and the ongoing AI investment cycle. At the same time, we believe inflation will remain structurally higher, driven by fiscal spending, deglobalisation and infrastructure investment, limiting the scope for lower long-term yields.
- We maintain a meaningful equity exposure while gradually reducing portfolio beta. We remain constructive on AI, but with a more selective approach, favouring high-quality names across technology, financials and healthcare.
- We used the recent semiconductor volatility to rebuild high-conviction positions at more attractive valuations, particularly in Asia, with SK Hynix re-entering our top ten holdings.
- In fixed income, we continue to run a low-duration stance, combining negative US duration with modestly positive European duration and a curve-steepening bias. We remain cautious on credit.
- As yields moved higher during the month, we took profits on some duration shorts, increasing overall portfolio duration to around 1.
- In FX, we took profits on Asian currencies, particularly the KRW, while maintaining an underweight US dollar exposure. We also increased our exposure to gold mining equities, which we believe continue to offer an attractive risk-reward profile at current valuation levels.

GLOSSARY

ESG data, ratings and portfolio indicators are provided for information purposes and should not be understood as a guarantee of investment performance or of any specific sustainability outcome.

Alpha: Alpha measures the performance of a portfolio compared to its reference indicator. Negative alpha means the fund performed less well than its reference indicator (e.g. if the indicator increased by 10% in one year and the fund increased by only 6%, its alpha is -4). Positive alpha means the fund performed better than its reference indicator (e.g. if the indicator increased by 6% in one year and the fund increased by 10%, its alpha is 4).

Beta: Beta measures the relationship between the fluctuations of the net asset values of the fund and the fluctuations of the levels of its reference indicator. Beta of less than 1 indicates that the fund “cushions” the fluctuations of its index (beta = 0.6 means that the fund increases by 6% if the index increases by 10% and decreases by 6% if the index falls by 10%). Beta higher than 1 indicates that the fund “magnifies” the fluctuations of its reference indicator (beta = 1.4 means that the fund increases by 14% when the index increases by 10% but also decreases by 14% when the index decreases by 10%). Beta of less than 0 indicates that the fund reacts inversely to the fluctuations of its reference indicator (beta = -0.6 means that the fund falls by 6% when the index increases by 10% and vice versa).

Capitalisation: A company's stock market value at any given moment. It is obtained by multiplying the number of shares of a company by its stock exchange price.

Duration: A bond's duration is the period beyond which interest rate variations will no longer affect its return. The duration is like a discounted average lifetime of all flows (interest and capital).

High yield: A loan or bond rated below investment grade because of its higher default risk. The return on these securities is generally higher.

Investment grade: A loan or bond that rating agencies have rated AAA to BBB-, generally indicating relatively low default risk.

Investment/net exposure rate: The investment rate constitutes the volume of assets invested expressed as a percentage of the portfolio. Adding the impact of the derivatives to this investment rate results in the net exposure rate, which corresponds to the real percentage of asset exposure to a certain risk. Derivatives can be used to increase the underlying asset's exposure (stimulation) or reduce it (hedging).

Modified duration: A bond's modified duration measures the risk attached to a given change in the interest rate. Modified duration of +2 means that for an instantaneous 1% rate increase, the portfolio's value would drop by 2%.

Net asset value: Price of all units (in an FCP) or shares (in a SICAV).

Rating: The rating measures the creditworthiness of a borrower (bond issuer).

Sharpe ratio: The Sharpe ratio measures the excess return over the risk-free rate divided by the standard deviation of this return. It thus shows the marginal return per unit of risk. When it is positive, the higher the Sharpe ratio, the more risk-taking is rewarded. A negative Sharpe ratio does not necessarily mean that the portfolio posted a negative performance, but rather that it performed worse than a risk-free investment.

SICAV: Société d'Investissement à Capital Variable (Open-ended investment company with variable capital)

VaR: Value at Risk (VaR) represents an investor's maximum potential loss on the value of a financial asset portfolio, based on a holding period (20 days) and confidence interval (99%). This potential loss is expressed as a percentage of the portfolio's total assets. It is calculated on the basis of a sample of historical data (over a two-year period).

Volatility: Range of price variation of a security, fund, market or index, which enables the measurement of risk over a given period. It is determined using the standard deviation obtained by calculating the square root of the variance. The variance is obtained by calculating the average deviation from the mean, which is then squared. The greater the volatility, the greater the risk.

Yield to Maturity: Yield to Maturity (YTM) is the estimated annual rate of return expected on a bond if held until maturity and assuming all payments made as scheduled and reinvested at this rate. For perpetual bonds, the next call date is used for computation. Note that the yield shown does not take into account the FX carry and fees and expenses of the portfolio. The portfolio's YTM is the weighted average individual bonds holdings' YTM within the portfolio.

ESG DEFINITIONS & METHODOLOGY

ESG data, ratings and portfolio indicators are provided for information purposes and should not be understood as a guarantee of investment performance or of any specific sustainability outcome.

ESG: E for Environment, S for Social, G for Governance

ESG score Calculation: Only the Equity and Corporate Bond holdings of the fund considered. Overall Fund Rating calculated using MSCI Fund ESG Quality Score methodology: excluding cash and non ESG-rated holdings, performing a weighted average of the normalized weights of the holdings and the Industry-Adjusted Score of the holdings, multiplied by (1+Adjustment%) which consists of the weight of positively trending ESG ratings minus the weight of ESG Laggards minus the weight of negatively trending ESG ratings. For a detailed explanation see “MSCI ESG Fund Ratings Methodology”, Section 2.3. Updated June 2023. <https://www.msci.com/documents/1296102/34424357/MSCI+ESG+Fund+Ratings+Methodology.pdf>

Principal Adverse Impacts (PAI): Negative, material, or potentially material effects on sustainability factors that result from, worsen, or are directly related to investment choices or advice performed by a legal entity. Examples include GHG emissions and carbon footprint.

SFDR Articles - Fund Classification: Sustainable Finance Disclosure Regulation, an EU Act that requires asset managers to classify funds into categories: “Article 8” funds promote environmental and social characteristics, “Article 9” funds have sustainable investments as a measurable objective.

Sustainable Investments: The SFDR defines sustainable investment as an investment in an economic activity that contributes to an environmental or social objective, provided that the investment does not significantly harm any environmental or social objective and that the investee companies follow good governance practices.

Taxonomy Alignment: In the context of an individual company, taxonomy alignment is defined as the proportion of a company's revenue that comes from activities that meet certain environmental criteria. In the context of an individual fund or portfolio, alignment is defined as the portfolio-weight weighted average taxonomy alignment of included companies. For more information, please follow this link: https://ec.europa.eu/info/sites/default/files/business_economy_euro/banking_and_finance/documents/sustainable-finance-taxonomy-faq_en.pdf

CHARGES

Share Class	One-time costs		Annual charges		Incidental costs ⁽²⁾
	Entry costs	Exit costs	Management fees and other administrative or operating costs	Transaction costs	Performance fees
A EUR Acc	Max. 4%	—	1.8%	0.35%	20%
F EUR Acc	—	—	1.15%	0.35%	20%

(2) Taken under specific conditions.

Entry costs: One-time cost you pay in when entering this investment. This is the most you will be charged. Carmignac Gestion doesn't charge any entry fee. The person selling you the product will inform you of the actual charge. **Exit costs:** We do not charge an exit fee for this product. **Management fees and other administrative or operating costs:** This estimate is based on actual costs over the past year. **Transaction costs:** This is an estimate of the costs incurred when we buy and sell the investments underlying the product. The actual amount varies depending on the quantity we buy and sell. **Performance fees:** when the share class overperforms the Reference indicator during the performance period. It will be payable also in case the share class has overperformed the reference indicator but had a negative performance. Underperformance is clawed back for 5 years. The actual amount will vary depending on how well your investment performs. The aggregated cost estimation above includes the average over the last 5 years, or since the product creation if it is less than 5 years.

MAIN RISKS OF THE FUND

EQUITY: The Fund may be affected by stock price variations, the scale of which is dependent on external factors, stock trading volumes or market capitalization. **INTEREST RATE:** Interest rate risk results in a decline in the net asset value in the event of changes in interest rates. **CREDIT:** Credit risk is the risk that the issuer may default. **CURRENCY:** Currency risk is linked to exposure to a currency other than the Fund's valuation currency, either through direct investment or the use of forward financial instruments.

The Fund presents a risk of loss of capital.
