

COULD WE BE ON THE BRINK OF A MAJOR CHANGE IN ENVIRONMENT FOR FINANCIAL MARKETS?

by Didier SAINT-GEORGES

- Head of Portfolio Advisors, Managing Director and Member of the Strategic Investment Committee

Kevin THOZET

- Portfolio Advisor and Member of the Investment Committee

Gergely MAJOROS

Following the Covid-19 crisis and the corresponding economic stimulus measures, the environment in which investors have been operating for the past 10 years could change dramatically in the medium term, with growth remaining weak but coupled with rising prices and higher interest rates.

The environment in which the global economy has been developing for the past decade may be entering a new phase as a result of the health crisis. This change could profoundly alter the behaviour of companies and consumers, and also that of stock market investors in the medium term, while economic growth is expected to remain weak.

The world economy has recorded sluggish growth over the past ten years, marked by stagnant prices and cuts in interest rates - with the latter in some cases becoming negative - under the impetus of the central banks which regulate economic activity. The worldwide outbreak of the Covid-19 health crisis last year led to additional measures by governments to boost the economy. These measures include financial aid to companies and, in the case of the United States, cheques of \$1,200 sent directly to individuals with annual incomes under \$75,000.

The various aid packages announced around the world and hopes of a return to normal life thanks to the Covid-19 vaccines have reassured investors. Since the beginning of the year, equities have gained nearly 2% worldwide, and have even jumped more than 70% since their low point in late March last year¹. They have almost doubled since January 2011.

However, the prospect of an improvement in the global economy could paradoxically generate fears in the financial markets today. After stalling in 2020, the much hoped for consumer-led economic rebound this year could lead to higher prices and interest rates. Too large a rate hike **could weigh on stock prices**. This is what investors fear particularly for the US economy which could pick up too abruptly, with growth remaining strong beyond 2021 and requiring hasty action from the central bank to avoid overheating.

Higher interest rates mean higher costs of borrowing and consumer loans. In addition, an increase in interest

rates can make equity investments less attractive to investors and savers, who are instead drawn to financial products offering higher returns such as bonds: securities that allow companies to finance themselves by borrowing money in financial markets.

Can the recovery last?

"To withstand a rise in interest rates, equities will need sufficiently strong growth in corporate financial results" explains **Didier Saint-Georges**, Member of Carmignac's Strategic Investment Committee. *"This should be the case this year given the expected economic recovery. But how long might this recovery last?"*

Last year's economic shock will certainly leave deep scars in certain sectors, such as aviation; the labour market is also very fragile and inequalities have increased further. It is also likely that the number of bankruptcies of small and medium-sized enterprises (SMEs) will increase considerably in the coming months, albeit with a time lag.

Heavily-indebted governments may also seek to raise taxes as of next year. However, the potential growth of the world economy has been declining steadily in recent decades, due to demographics, excessive debt, lack of investment, etc.

Potential gross domestic product (GDP) growth

A medium-term scenario of continued weak global growth coupled with rising prices is therefore a serious possibility, which could create a **challenging environment** for the stock market.

"The United States is where the most instability lies, so that is where we are focusing the bulk of our risk management," emphasises **Kevin Thozet**, a member of Carmignac's Investment Committee, warning of the effects that a possible correction in the US financial markets could have on Europe.

For the time being, Europe presents relatively little risk of overheating, but its environment also offers limited growth potential. *"This may encourage investors to pick stocks which they hope will outperform the stock market indices. This is exactly what we do in our diversified funds such as **Carmignac Patrimoine** and*

Carmignac Portfolio Patrimoine Europe, "notes Kevin Thozet.

China, on the other hand, looks to be a healthy investment area. China's exports benefited greatly last year from support plans in the US and Europe, and the country is set to benefit from the global recovery. Moreover, price rises there are very modest. And unlike other countries, China still has room to lower interest rates if necessary.

"In this context, we continue to adopt a "barbell" strategy, which consists in investing simultaneously in assets with opposite risk profiles," explains **Gergely Majoros**, a member of Carmignac's Investment Committee. "We are investing both in stocks where we expect strong long-term growth and visibility, with a significant portion in China, and also stocks that should benefit from the reopening of the economy in the shorter term."
